

**SPECIFICATION AMENDMENTS**

Please amend the paragraph bridging page 5 and page 6 as follows:

The first optical zone 12 typically is an intermediate to far distance optical zone for vision at primary gaze. The first optical zone covers the upper portion of the central optical zone. Preferably, the lower boundary line with the optical blending zone of the first optical zone is at or below a horizontal line passing through the center of the central optical zone (the horizontal meridian or line parallel with the horizontal meridian) at least in its central portion 18 (i.e., around the intersection point of the lower boundary line with the vertical meridian or with a line parallel to the vertical meridian and passing through the center of the central optical zone). More preferably, the lower boundary line with the optical blending zone of the first optical zone is below a horizontal line passing through the center of the central optical zone.
